

This assessment aims to give our company a good idea regarding your development school of thought and workflow.

Please start the actual work requested within the assessment after reading the whole assessment carefully

Introduction:

A pharmacy [ABC] needs to create a Salesforce environment to manage customers, product lists, and orders. The pharmacy also has a web app developed on Ionic and requires integration with Salesforce. The pharmacy has one warehouse location with one warehouse user destined to view the orders to commence the outbound deliveries and quantity change updates.

Salesforce Setup:

- Create a Salesforce developer org for this project.
- For any newly created field/object/apex class...etc amend "abc" in the API name
- Design and implement a data model to handle customers, products, and orders.
- Create a lightning custom app for the business stakeholders to manage the customers, products, and orders.

API Integration:

- Implement a REST API endpoint on Salesforce to retrieve the product list for the Ionic app.
- Implement a REST API endpoint to allow end-users to create a shopping cart and add products to the cart.
- Implement error handling and logging best practices in your code.
- Document the API endpoints with expected inputs and outputs to share with Ionic app developers.

Visualforce pages:

- Implement a visualforce page for the warehouse to view all the orders; the order number, status, effective date. For each order that is created today this icon ⌚ should show before the order number, for any order that is created in the past (less than today) this icon ⌚ should show before the order number. For any order that has a status "In delivery", this should be the icon 🚚 before the order number. For any order that has a status "Delivered"; this should be the icon ✅ before the order number.
- Each order row of this table should be expandable to show the ordered products within the order; the product name, quantity, and unit price.

Batch Class:

- For any order that has a status "Delivered" and the "Order Date" is more than a year old; the order should be archived in a big object.

Note: You are free to use any researching tools; but avoid assistance from other salesforce experts.

Assessment Requirements:

1. Salesforce Access

Create a new **System Administrator** user in your Developer Org with the following details so our team can review the application and code without requiring access to your personal verification codes:

- **Username:** Use a unique username (for example: `assessments@cloudastick.com.<your-org>.com` if a unique suffix is required)
 - **Email:** `assessments@cloudastick.com`
 - **Profile:** System Administrator
 - **User License:** Salesforce
-

2. Postman Collection

Please share a **Postman Collection** containing all implemented API endpoints, ready for import and testing.

3. Solution Documentation

Provide **clear, well-structured, and professionally formatted documentation**. The documentation should follow a standard technical documentation format and demonstrate your ability to clearly communicate technical solutions to other developers and stakeholders.

Your documentation should include:

a. Apex Components

- List all Apex Classes, Test Classes, Triggers, and any other custom components created.
- Briefly describe the purpose and responsibility of each component.

b. Data Model

- Include a Data Model Diagram (ERD) illustrating all objects and their relationships.
- List all standard and custom objects used.
- Describe the purpose of each object and any key relationships.
- Highlight any important design decisions or assumptions made while modelling the data.

c. Salesforce Features

- List all Salesforce features and technologies used (e.g. Lightning App, Visualforce, Batch Apex, Flows, Validation Rules, Permission Sets, etc.).
- Explain why each feature was chosen and how it contributes to the solution.

Note: The quality of your documentation is part of the assessment. Write it as if it were being handed over to another Salesforce consultant or development team, demonstrating your ability to produce professional, maintainable technical documentation.
